

Email To SMS Gateway

With our Email to SMS gateway you can **effortlessly** send text messages from your any email client, such as Microsoft **Outlook**/Outlook Express, Lotus Notes, Eudora, Elm, Pine, Unix Mail. Current uses include:

- Forwarding email
- Office voicemail notification
- System operation alerts/alarms
- Personal communications
- Product promotion
- Employee communications

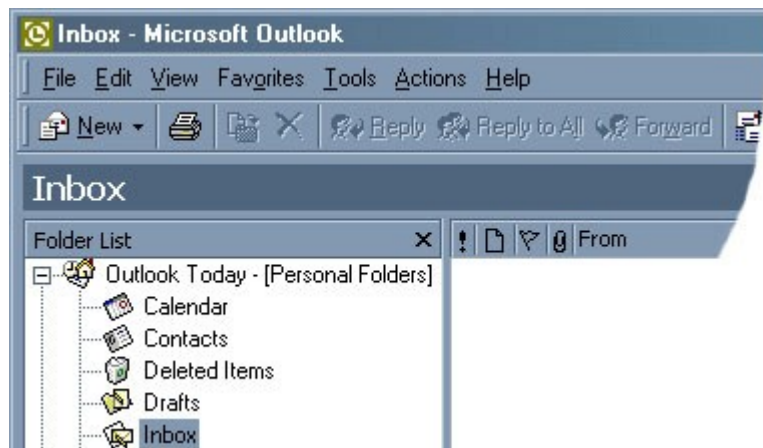

No plugins or installation is required. Simply use the software you already have on your computer. You **simply send an email** to **mobile@sms.world-text.com**.

If combined with our service the Email to SMS gateway becomes a **bidirectional** service allowing two-way communication between email and mobile phone.

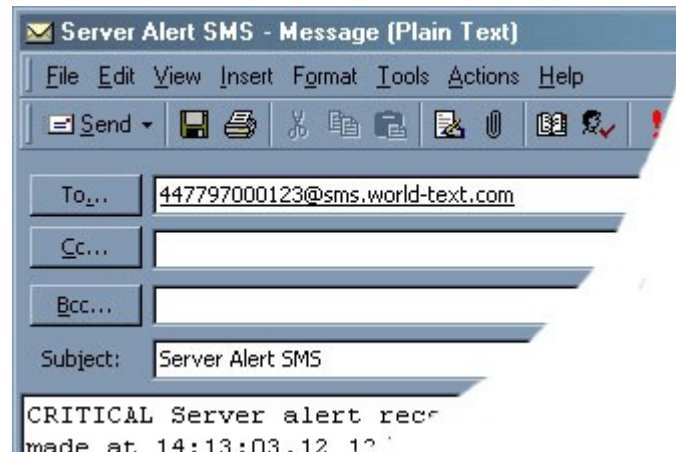

Using From Windows/Mac

Once setup using the service could not be easier. From your favourite email client simply select create a new message.

In this example on *Microsoft Outlook*, this is achieved by clicking the *New* button on the top left of the application.

Now address the message as show in this next image.

The mobile number should be specified in international format, this is a UK mobile number starting 077... and has had the leading 0 replaced with the UK dialing code 44.

Now enter the subject and message as you would normally, but remember 160 characters is the limit.

All that remains to be done is for you to click *send*.

Using From Linux/UNIX

UNIX offers very powerful scripting features making it very simple to send a message manually or more usefully, automatically to the SMS gateway. Since there are so many varied ways to send messages we will provide only one simple command line example here:

```
echo "Server CRITICAL at `date`" | mail 447797000123@sms.world-text.com
```

If you require any further help then we have UNIX experts available who can provide consultancy to help develop your own scripts/programs in almost all well known languages.

Using From A Web Page/PHP

If you want to send messages from your own web page, then this can be achieved simply in [PHP](#) by using the built in *mail* command. If you require a sample PHP script then please contact us and we will be happy to email one out to you.

This service is available either on prepay or monthly [invoiced contract](#).
